ISSUE
Some 2004-2006 F-150 and 2006 Mark LT vehicles may exhibit water leaking back into the cab and on to the passenger floor from the A/C plenum drain tube area.

ACTION
Refer to the following Service Procedure to determine if the water leak is from the air conditioning drain tube.

SERVICE PROCEDURE
1. Verify that the water leak is from the heating ventilation air conditioning (HVAC) case drain seal and not from another source. Pull back the carpet on the passenger floorboard and feel the HVAC drain tube seal for water (Figure 1A-1B) The concern may be verified easier with the front of the vehicle slightly elevated.
   a. If there are signs of water or moisture at the drain tube seal, continue on with the TSB.
   b. If there are no signs of water or moisture, follow normal diagnosis and repair procedures.

NOTE
THE VEHICLE SHOULD BE COOL BEFORE ATTEMPTING THIS PROCEDURE.

2. Remove the right front wheel.

3. Remove the right front fender inner splash shield. Refer to Workshop Manual (WSM), Section 501-02.

4. Remove the transmission dip stick tube retaining bolt and position the tube to allow additional hand clearance. Refer to WSM, Section 307-01.

NOTE: The information in Technical Service Bulletins is intended for use by trained, professional technicians with the knowledge, tools, and equipment to do the job properly and safely. It informs these technicians of conditions that may occur on some vehicles, or provides information that could assist in proper vehicle service. The procedures should not be performed by “do-it-yourselfers”. Do not assume that a condition described affects your car or truck. Contact a Ford, Lincoln, or Mercury dealership to determine whether the Bulletin applies to your vehicle. Warranty Policy and Extended Service Plan documentation determine Warranty and/or Extended Service Plan coverage unless stated otherwise in the TSB article. The information in this Technical Service Bulletin (TSB) was current at the time of printing. Ford Motor Company reserves the right to supersede this information with updates. The most recent information is available through Ford Motor Company’s on-line technical resources.
5. Locate the HVAC drain tube protruding from the bulk head. Clean all dirt and debris from the drain tube end. (Figure 2)

6. Using Silicone Brake Caliper Grease and Dielectric Compound, lubricate the short end of the new 90 degree rubber elbow. Push the elbow onto the drain tube and orient the long end pointing straight down. (Figure 3)

7. Reposition the transmission dip stick tube and tighten the retaining bolt to 9 lb-ft (12N•m).

8. Reinstall the inner splash shield, Refer to WSM, Section 501-02.

9. Reinstall the right front wheel.

10. Verify transmission fluid level is correct.
